Vehicle and Registration Responses (release 3.0.0)

Introduction:

Nlets, the International Justice and Public Safety Information Sharing Network, is a message switching system serving the criminal justice community. It provides for inter- and intra-state transmission of criminal justice and related information. Nlets is supported by a central computer system located at the Nlets Data Center facility in Northern Phoenix, through which all Nlets traffic to federal, state and local law enforcement and state motor vehicle offices is routed.

The Registration Inquiry transactions are some of the most commonly used transactions on Nlets. A typical inquiry will be sent through the inquirer's DPS via their state switch to Nlets. Nlets forwards the massage to the requested destination(s). The DPS in the destination state will receive the inquiry and request the registration information from its Department of Motor Vehicles (DMV). The retrieved registration information is then returned to the inquirer along the same route.
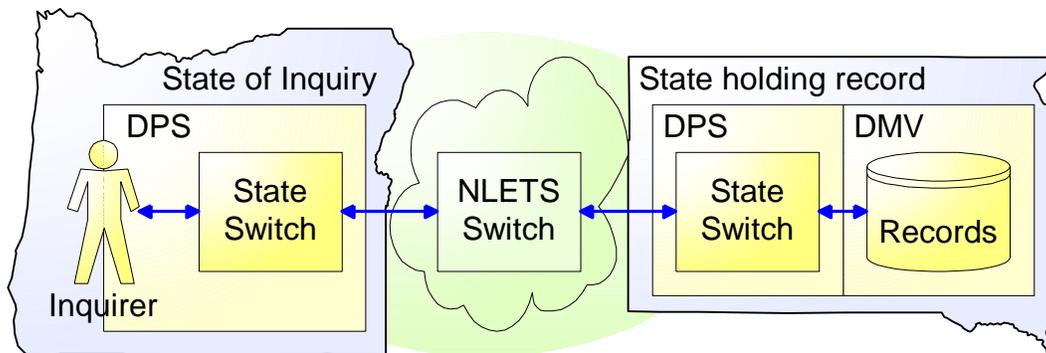

Until 2009, the Nlets legacy system had no national standard defining the format or content of the detailed vehicle and registration records exchanged through Nlets. Because of this, when law enforcement personnel in one state request information on a vehicle whose records are located in another state, responses containing state-specific data elements, formats and definitions are returned. The requesting officer must contend with 51 potentially different sets of registration data.

AAMVA has a standard which is used to communicate information about Vehicles and Registrations between DMVs and their business partners. Because the vehicle information transmitted over Nlets

originates at the DMV, it has been possible to standardize the Nlets vehicle and registration responses by utilizing the AAMVA standard already in use.

In 2009, Nlets convened a committee that included members of the Nlets community along with representatives from AAMVA to draft the CANDLE specification (CANDLE is an acronym for **C**ollaboration between **A**AMVA and **N**lets for **D**river **L**icense **E**xchange).

At the time, the Department of Justice built an XML data model to facilitate the exchange of information between parties in the justice community. The model was called the Global Justice XML Data Model (GJXDM). To determine which of the GJXDM elements to include in the response message, the CANDLE committee selected the Registration elements that were needed by law enforcement in the Nlets Registration transactions.

In 2012 Nlets reconvened the committed to update the CANDLE specification. By that time a new XML data model called the National Information Exchange Model (NIEM) was created as an outgrowth of the GJXDM Project. The traditional GJXDM data elements were incorporated into the NIEM data model as the JXDM NIEM Subdomain and standalone support for the GJXDM data model expired. The CANDLE specification was updated to use the data elements from the NIEM model to replace the GJXDM elements. Additional Data Elements were added to the specification as well to address the growing needs of the DMV data exchange communicate. At the time of the drafting of that specification, the NIEM data model was at version 2.0

In 2021 Nlets reconvened the committed again to update the CANDLE specification. As of 2021 the NIEM Data model is at version 5.0. The 2021 CANDLE update, as described in this documentation, replaces NIEM 2.0 data components with their equivalent NIEM 5.0 components, Additional data elements have also been added in this round of updates to meet the evolving needs of the DMV exchange community.

Individual states have their own element definitions that are used within their state to support their own laws and rules. The standardized response is designed to be used for communicating between states. The standardized response, however, may be used as a model for the in-state messages as well.

Schemas for the Messages:

To assist in the implementation of the standardized responses, XML schemas have been built for the Vehicle and Registration responses. These schemas define the content and format of the XML messages. They are designed to be imported into the payload part of the Nlets XML Registration Response messages (types RR and RNR).

The two schemas are the Registration Match List schema and the Registration Status schema. The state providing a response to an inquiry will populate the payload of the response message using the format described in one of these schemas.

The Registration Match List schema includes a summary list of matches found. It is used when an inquiry resulted in multiple matches being found on a states records (i.e. a RNQ registration inquiry by name and date of birth may locate multiple vehicles). Rather than return all the details of all the matches, a summary list is returned. The inquirer can then make a more precise inquiry to select the details of an individual match.

The Registration Status schema is used when an inquiry resulted in a single match on the states.

The schemas were built using the NIEM Core release 5.0 and the JXDM NIEM subdomain release 7.0. The NIEM Core and JXDM subdomain contains XML definitions of information used in the justice community and is designed to facilitate the sharing of information in that community. The Registration schemas use the NIEM by referencing the elements in the NIEM, JXDM and Emergency Management subdomains, hence picking up their definitions.

The full list of namespaces used are as follows:

Domain	Prefix	URI
NIEM Core	nc	http://release.niem.gov/niem/niem-core/5.0/
JXDM	j	http://release.niem.gov/niem/domains/jxdm/7.0/

Any time additional elements need to be added to an entity beyond what is defined in the NIEM core specification, a derived version of the element is created in a separate schema subset and added to the n2c namespace whose URI is "http://www.nlets.org/niem/nlets-core/2.0". These n2c derived elements are substitutable in an XML document for the element upon which they are based. By way of example if the schema allows for a nc:DriverLicense element at a particular location in an XML document, the n2c:DriverLicense element should be placed there instead

In order to allow for the base components of the response (RegistrationStatusand RegistrationMatch) to be useable in contexts beyond the Nlets transaction, the definition for those elements exist in their own schemas along with their own namespaces and prefixes:

Element	Prefix	URI
RegistrationStatus	nrs2	http://www.nlets.org/niem/nlets-driver-status/2.0
RegistrationMatch	nrm2	http://www.nlets.org/niem/nlets-registration-status/2.0

The Prior version of the CANDLE Specification contained elements for both a code and a textual description of a given property. The Code based elements were constrained to a specific list of values and the Textual based elements allows for any content. Given the challenges within the community of being able to make the data available in the data repositories match the constants of the Code elements, this version of the CANDLE specification has done away with Code based elements entirely. It will, however, be our official recommendation that the content of the Textual based elements be the same as the Code based elements

A DMV or a DPS may hold additional information about a vehicle or registration (i.e. ownership information specific to the state). A method for extending the response has been included in the solution to allow additional information to be incorporated.

In the message descriptions below, there are four columns: Entity, XML Type/Size, Min - Max and Explanation. A brief explanation of each column is contained in the following bulleted items.
- The Entity column lists the XML tag name of the element or attribute in the message. Where possible, GJXDM elements are used. These elements are prefixed with the "j2:" name space. The GJXDM convention for naming elements has the first letter of the tag in upper case, while attributes start with a lower case letter. The column also indicates nesting of the element in the XML structure by using a dash to indicate each level of nesting.
- The XML Type/Size column indicates the format of the element. XML types are specified for elementary elements. XML types include:

--	a group elements that holds sub-elements, they hold nothing that requires a format
string	an alpha-numeric string of characters (the escape characters "<", ">", "&", "'" and """ should be replaced by their entity references)
string (*coded*)	an alpha-numeric string of characters that holds a coded value defined in an enumerated list of the schema.
year	a year in the format "yyyy"
month	a month in the format "--mm"
date	a date in the format "yyyy-mm-dd"
decimal	a number that includes decimal places
integer	a whole number
nonNegativeInteger	a positive whole number
boolean	a "1" for true or a "0" for false
(*attribute*)	an XML attribute of the proceeding element

- The Min – Max column indicates the minimum and maximum number of repetitions of an element. Most of the elements have a cardinality which allows the element to be omitted, this had to be done because not all states have all the elements. So if a state does not have access to a particular element, the element mat be omitted from the response.
- The Explanation column contains a description of the element.

Mapping Nlets XML:

The following tables list the elements in the Nlets XML responses, the Nlets Legacy response and their corresponding AAMVA elements. The Nlets XML column lists the tag names of the elements and attributes in the message and the source column identifies the code and name of the corresponding AAMVA element.
